Comparison

⑤ Conclusion

Popular Use

- Airplane
- Cruise Ship
- Rural Area

Similarity

All three are either in or travel through area with little to no ground station.

Provide Internet for the whole world

Fact

Over 3.7 Billion people are living without being connected to the internet.

① Introduction

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

- Geostationary satellite (GEO)
- Gateway
- Antenna
- Others:
 - Modem
 - Centralized NOC

Figure: GPS using A-GPS and GSM network

Conclusion

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

- Upstream: Data travelling through telephone modem
- Downstream: Download through satellite

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

- Upload speed: Same as that of the dial-up internet
- Download speed: Much faster than dial-up internet
- Latency: Still high, much lower than two way satellite internet
- You have to tie up the telephone line when you use the Internet

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

Components

- 1 transmitting hub station (usually very large)
- Multiple receive-only Earth stations

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

- Usage: IP multicast-based data, audio and video distribution
- Interactivity: Little user interface, similar to TV or radio content

Introduction

1-way to Earth

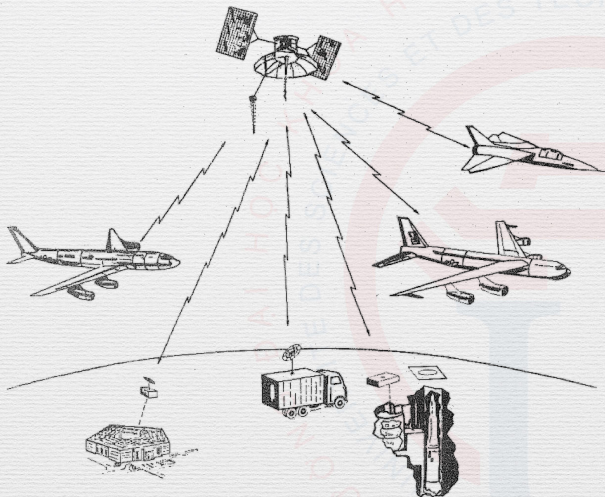

2-way

Limits and
Challenges

Mitigations

Conclusion

AFSATCOM SYSTEM

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

- VSAT: Send and receive data
- Telecommunication port:
Relay data through Internet

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

Satellite dish must be precisely pointed
to avoid interference.

Introduction

How It Works

1-way from Earth

1-way to Earth

2-way

Limits and
Challenges

Mitigations

Conclusion

- Both TDMA and single channel per carrier
- Mostly Ku-band, but also C-band and Ka-band
- May utilize telephone modem to reduce latency
- Home-user's bandwidth based on payment
- Difficult on moving vehicles

Portable

- Use self-contained box pointed in general direction of Satellite
- Expensive

Satellite phone

- Omnidirectional antenna so no alignment needed
- Low bandwidth so slow to browse net, useful for sending email

 - 1-way to Earth
 - 2-way
- 3 Limits and Challenges**
 - Weather
 - Latency
 - Others
- 4 Mitigations
 - Techniques
 - Comparison
- 5 Conclusion

- Fading
- Accumulating raindrop or snow
- Wind

Satellite altitude

- LEO: < 2000 km
- MEO: $2000\text{--}35\,786$ km
- GEO: $> 35\,786$ km

Result

GEO has 12 times higher latency than terrestrial base networks. LEO and MEO have a bit lower delay.

Economically

Costly: 2 Mb/s costs around \$100 a month.

Environmentally

Space junk: Only 2000 out of 5000 launched satellites are still in function.

Common functions:

- *Monitor* link quality by continuous measurements
- *Predict* short-term behavior and duration of satellite channel's next state
- *Set* parameters based on previous estimation

- $EIRP = \text{transmitted power} \times \text{antenna gain}$
- EIRP control = adjusting carrier power or antenna gain to compensate for power losses

- ① Open loop: Based on recently received power.
 - Non-reliable
 - Responsive
- ② Closed loop: Based on channel power measurements.
 - More comprehensive
 - Large propagation delay

- Vary carrier power at the earth station
- Restoration of side lobes might lead to adjacent *channel* interference

- Increase of earth station transmit power may cause adjacent *satellite* interference*
- Effective and preferred by many satellite operators

*Satellites are separated by 2–3 degrees on the geostationary orbit.

- Vary carrier power on-board the satellite
- Difficult to implement due to satellite size and weight limitations
- Subject to
 - ① Adjacent *channel* interference
 - ② *Intermodulation* interference
 - ③ *Intersystem* interference (with terrestrial networks)

- Adjust antenna gain on-board the satellite for a certain geographical region
- Shape satellite antenna for nearly constant ground receive power, even under rainfall
- Does **not** need expensive calculations for attenuation estimation[†]
- Technology and research are WIP

[†]SBS compensates the entire coverage area instead of a single site.

- Modify processing/transmission manner of signals
- Resource-shared techniques
- Categories:
 - ① Hierarchical coding
 - ② Hierarchical modulation
 - ③ Data rate reduction

Mitigations

Techniques

EIRP Control
Techniques

Adaptive
Transmission
Techniques

Diversity Protection
Schemes

Comparison

Conclusion

- Add redundancy to the information signal
- Trade-off between bandwidth and error probability
- Different conditions require different coding schemes
- Prioritize users with less efficient coding schemes, i.e. longer bursts (TDMA) or larger bandwidth (FDMA)

Introduction

How It Works

Limits and
Challenges

Mitigations

Techniques

EIRP Control
Techniques

Adaptive
Transmission
Techniques

Diversity Protection
Schemes

Comparison

Conclusion

- Provide lower quality fallback in case of weak signals
- Exchange bandwidth efficiency for power requirements
- Suitable for localized satellite systems, e.g. VSAT
- Users with lower-order modulation get more resources

How It Works

Limits and
Challenges

Mitigations

Techniques

EIRP Control
Techniques

Adaptive
Transmission
Techniques

Diversity Protection
Schemes

Comparison

Conclusion

- Reduce information data rate for power gain
- Distribute satellite resources equally to every user
- Utilizable where significant information rate reduction is tolerable, e.g. video or data but voice transmission

EIRP Control
Techniques

Adaptive
Transmission
Techniques

Diversity Protection
Schemes

Comparison

Conclusion

- Use multiple channels with different characteristics
- Oriented against rain fades and highly efficient
- Performance criteria
 - Diversity gain: difference between site attenuation and joint attenuation, for the same probability level
 - Diversity improvement: ratio of site exceedence probability to the joint one, for the same attenuation value

Diversity	Setup	Efficiency	Cost
Site	Connected earth stations	High	High
Orbital	Earth station may choose between satellites	Low	Low
Frequency	Use lower frequency on higher attenuation	Adaptive	Terrestrial equipments
Time	Repeat faded data	Selective [‡]	N/A

[‡] . . . of fade duration

Tech	Availability	Max gain (dB)	Cons
ULPC	0.01–10 %	5 (VSAT) 15 (hubs)	power range
DLPC	0.01–10 %	3 (sat. TWTA)	power range
SBS	0.01–1 %	5 (sat. antenna)	immature research

Table: Comparisons between EIRP control techniques

Tech	Availability	Max gain (dB)	Cons
HC/HM	0.01–10 %	10–15 (E_b/N_0 range)	fading in many stations
DDR	0.01–10 %	3–9	low rate intolerant

Table: Comparisons between adaptive transmission techniques

Tech	Availability	Max gain (dB)	Cons
SD	0.001–0.1 %	10–30 (conv. rain)	cost
OD	0.001–1 %	3–10	satellite switch
FD	0.01–10 %	30 (Ka–Ku)	cost

Table: Comparisons between diversity protection schemes
